🗓️ Practice Day

Problem 1 Create and Write to a File

Write a function create_file(filename, content) that creates a new text file with the given filename and writes the content into it. Call it using positional arguments.

📥 Sample Input:

```
"notes.txt", "Hello, this is my first file."
```

📤 Sample Output (notes.txt will contain):

```
Hello, this is my first file.
```

Problem 2 Read Lines with Line Numbers

Write a function read_lines(filename) that reads a text file and prints each line with its line number.

📥 Sample Input (file: data.txt):

```
Apple
Banana
Cherry
```

📤 Sample Output:

```
1: Apple
2: Banana
3: Cherry
```

Problem 3 Append Log Entries to a File

Given a filename log.txt, use file append mode to add a new log entry each time the function add_log(message) is called. Each message should appear on a new line.

📥 Sample Input:

```
add_log("User logged in")
add_log("File uploaded")
```

📤 Sample Output (log.txt will contain):

```
User logged in
File uploaded
```

Problem 4 Read from a Specific File Pointer Position

Write a function read_from_position(filename, position) that uses the file pointer to start reading a file from a given byte position and prints the remaining content.

📥 **Sample Input:**

```
filename = "hello.txt"   # contains: "Hello, World!"
position = 7
```

📤 **Sample Output:**

```
World!
```

Problem 5 ⭐ Conceptual Session — Safe File Read with Full Exception Handling

Write a function safe_read(filename) that tries to open and read a file. Use try, except, else, and finally blocks:

- Print file content if successful (else block)
- Handle the case where file does not exist (except block)
- Always print "Operation complete." at the end (finally block)

📥 **Sample Input 1:**

```
safe_read("missing.txt")
```

📤 **Sample Output 1:**

```
Error: File not found.
Operation complete.
```

📥 **Sample Input 2:**

```
safe_read("hello.txt")   # contains: "Hello, World!"
```

📤 **Sample Output 2:**

```
Hello, World!
Operation complete.
```
